

Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

VII. *An Account of a Book Intitled, Dissertatio Epistolaris de Glandulis conglobatis Duræ Meningis humanæ, indeque ortis Lymphaticis ad Piam Meningem productis. Authore Antonio Pacchiono. Romæ 1705. 8vo.*

THIS Dissertation seems to be only a Supplement, or *Appendix*, to a Treatise of the *Dura Mater*, which our Author, that Industrious and most Inquisitive Anatomist, *Pacchionus*, had publish'd sometime before. In this his chief Design is to inquire into the Service, and find out the Origin of that Humor, which moistens the Brain and its Membranes in every dead Animal.

He mentions three things, which kept him from engaging in this Inquiry much sooner.

The first was, because the Accurate *Nuchius* very much blamed their freedom, who were too forward in admitting any Lymphatick Vessels in the Brain: for he freely owns, that he could never succeed in this matter, tho' with the greatest exactness he had often attempted it.

The next was, because the Great *Malpighius*, who was so curious and happy in discovering the Glands of the *Thorax* and *Abdomen*, did never take the least notice of any in the *Dura Mater*.

The third Obstacle, that stood in his way, was the texture of the Membrane itself; which is so thick, and composed of Fibres so very strong, that they seem almost

most to be Muscular, and probably altogether unfit for lodging any such bodies as Glands are.

But at last the Knife removed all these Difficulties, and he happily succeeded in the Discovery of the following Olands, which are the Subject of this Book.

Before he describes these Glandulous Bodies, he premises a short Account of the Structure of the Longitudinal and Lateral *Sinus's* of the *Dura Mater* ; but adds little or nothing to what the Renowned *Willis*, and the Sagacious *Vicussens*, have already said on that Subject.

In examining the Cavity of the Longitudinal *Sinus*, immediately under its membranous Expansions, in the *Area* or middle of its *Cordæ*, mention'd by Dr. *Willis*, (that is, the small transverse Fibres, which like Ropes keep the Walls of this *Sinus* from being over-dilated by the influent Blood,) our Author had the good Fortune to discover a great number of Conglobate Glands, which are all contained by a fine and proper Membrane, as in a Bag. For the most part they appear in Clusters, and are seldom scatter'd here and there. Their Figure is roundish ; and in bigness they equal a Silk-worms Egg, if inspected as soon as the Body is opened ; but if the *Meninx* be macerated in Vinegar for a Month, or more, they are bigger than a Millet Seed. In Old People, and in those who have died of a lingering Disease, they may be seen by the naked Eye, without any Microscope, or previous Preparation. They are incompass'd with fine Carnous Fibres ; whence they put on a pale Colour : But when these Fibres are much relaxed, as happens in an *Hydrocephalus*, or Comatose Distempers of the Brain, they become white and very big.

In the *Lateral Sinus's* they are seldom or never observed; because in those, he thinks, they would have been more subject to the superincumbent weight and pressure of the Brain, which would much have incommoded their Office; but by their situation in the *Longitudinal Sinus*, there could no such inconveniency happen.

From the aforesaid Glands innumerable fine Threads arise, and are only their Excretory Vessels, which are spread all over the inside of the *Pia Mater*, being accompanied and strengthened in their course by Fibres and other Blood Vessels. It is these Fibres which join the *Meninges* to one another: And if you take care that the *Dura Mater* be not hurt in taking off the upper part of the Scull, in dividing these Membranes, you may observe Liquors of different colours ouze and drop from them when cut.

Our Author is not positive that these Excretory Ducts penetrate into the Medullary Substance of the Brain; but affirms, that they creep along its inner Protuberances and accidental Cavities. This Discovery confirms what *Bohn* and some others have said about the Lymphatics of the Brain; but before our Industrious Author, none did ever so much as pretend to fix their Origination, which he has traced from the Glands lodged in the *Longitudinal Sinus*, as above.

The Use he assigns to these Glands, is to separate and strain a particular kind of Humor from the Blood; which, in his Opinion, may serve to keep the Membranes and Surfaces of the Cavities and Protuberances of the Brain from growing too dry by their continued Motion. When this Humor becomes either deficient and wanting, or exuberant and in too great a quantity,

tity, the Parts above-named are unfit for the Natural discharge of their respective Offices, whence several dangerous Distempers must necessarily follow: He adds some Cases of this kind, which he has observed in the Dissection of morbid Bodies.
